

Trading Platform Analysis: Key Findings and Next Steps

Summary:

This report shares the main discoveries from our trading platform dashboard. We found that the business relies heavily on the **Crypto market** and that a very small group of **High Risk** users brings in most of the money. Our charts show that market activity (volatility) is very **cyclical**, with big spikes happening at the start and end of the year. Our suggestions focus on spreading out our business risks and getting ready for those big trading months.

1. Why We Chose These Charts (Visual Design Logic)

We designed the dashboard to show the most important numbers first, then trends over time, and finally, breakdowns by user and asset type.

Chart Type	What It Shows	Why We Picked It
KPI Cards (4)	Total Money Traded, Total Number of Trades, Total Users, Average Trade Value per User	These are the most important numbers, placed at the top so everyone sees the overall health of the platform immediately.
Line Chart	Average Daily Price Change % by Month	This chart tracks how much prices change over time. It helps us see when the market is the most active (high change) and when it's quiet (low change).
Bar/Column Charts	Total Trade Value by Top 5 Users , Total Trade Value by Risk Profile	These are best for ranking and comparing . The Top 5 Users chart quickly highlights the few people who bring in the most money (a potential risk).
Pie Chart	Total Trade Value by Asset Type	This is the clearest way to show the parts of a whole—in this case, how much money comes from Crypto versus Stock.
Table View	Asset Volatility (Bullish Days,	We need this table for

	Price Change %)	analysts to see the specific details, like the average price change and the number of "up" days for each crypto asset.
Slicers	Year, Month Name	These are mandatory tools. They let users interact with the dashboard, instantly changing the view to look at only one year or one month.

2. Key Discoveries About the Market and Users

Market Imbalance

- **Crypto Dominance:** The Pie Chart shows the platform relies almost entirely on the **Crypto** market, which provides about **98.36%** of all money traded. The Stock market is only a tiny fraction (1.64%).
- **Activity Peaks:** The Price Change Line Chart confirms that market activity peaks in **April** and **December**. The market is quietest and most stable in **June** and **July**.
- **Money is Concentrated:** The charts show that most of the money comes from a small number of users. The **High** and **Medium** risk users bring in about **90%** of the trade value. Worse, the Top 5 Users chart shows that a tiny group of customers is responsible for a huge portion of the **\$507M** total value.

User Behavior

- The chart showing **Total Unique Users by Risk Profile** tells us that we have many "Low" risk users, but they are not spending much money. The few "High" risk users are driving the business value.

3. Performance Metrics (What Our DAX Calculations Tell Us)

Market Movements

- **Volatility is Fast:** The Avg Daily Price Change % line chart shows sharp, rapid swings month-to-month. This means when the market moves, it moves fast. Our platform needs to be ready to handle quick changes.

Business Health

- **Misleading Average:** The **Avg Trade Value per User** KPI (\$1.69M) looks very high, but this number is heavily inflated by the few high-value users (the Top 5). If you filter the dashboard to look at "Low" risk users, this average drops dramatically. This KPI is deceptive on its own.
- **Asset Risk:** The table view shows which assets are the most unpredictable:

- **SOL** (Solana) has the highest average daily price change (**1.23%**), making it the most volatile (risky) asset.
- **BTC** (Bitcoin) has the highest number of "up" days (**1609**), meaning it is the most consistently strong performer over time, even if its daily price change percentage is lower.

4. Recommendations and Next Steps

Based on these facts, here is what the business should do:

Recommendation 1: Reduce Reliance on Key Users

- **What to Do:** Create a special customer service program just for the Top 5-10 users to keep them happy. At the same time, we must focus on getting the next 50 high-potential users to spend more money. This spreads out the risk if one of the big users leaves.
- **What to Watch:** Track the amount of money the Top 10 users contribute. We want this percentage to decrease over time.

Recommendation 2: Prepare for Busy Months

- **What to Do:** Get our marketing team and technical support ready before the confirmed busy periods of **April** and **December**. We need to make sure our servers can handle the high transaction volume during these months.
- **What to Watch:** Compare how much money is traded in the quiet months (June/July) versus the busy months (April/December) to see if our planning efforts are working.

Recommendation 3: Start Selling More Stocks

- **What to Do:** We must invest in promoting the **Stock market segment** to achieve more stable revenue. Relying 98% on Crypto is a huge, dangerous risk if the crypto market ever crashes.
- **What to Watch:** Track the **Total Trade Value by Asset Type** (Pie Chart). Our goal is to increase the Stock segment's contribution by at least 5% within the next six months.
